while multiple qubits in a quantum register should behave independently their connection to a common environment may spoil that independence as they start to influence each other via the environment in this work two qubits modelled by magnetic spin 1/2 impurities are investigated which are coupled at a finite distance to the same dissipative environment from the spin boson model it is known that there exists a phase for weak coupling where the spin is not localised in any state and may thus explore the whole $su(2)$ Bloch sphere while for strong coupling it is localised in one of two configurations completely destroying its quantum mechanical nature as a second spin is coupled in direct vicinity of the first the environment mediates an effective ferromagnetic interaction between the spins rendering them no longer independent within the numerical renormalization group nrg it is investigated at which point the two spins can be treated independently as the distance between them is increased to this end a two channel bosonic nrg is developed that can deal with the model and its limit of two independent spin boson models the two channel nrg is first tested on a model incorporating a single oscillator as an impurity while the latter model only involves a single channel a self interaction of the impurity oscillator provides accessible limits where the numerical implementation of the two channel nrg can be tested furthermore signals of the different impurities are traced in the environment by means of thermal averages and their changes due to the presence of the impurities das werk behandelt den einfluss von quantenstörstellen innerhalb einer dissipativen umgebung sowohl aufeinander als auch auf ihre umgebung die störstellen werden hierbei entweder durch einen oszillator oder durch zwei qubits realisiert da die betrachteten systeme für eine vielzahl von parametern nicht analytisch lösbar sind wird eine zwei kanal nrg numerische renormierungsgruppe für bosonische modelle entwickelt details dieser nrg und ihrer implementierung werden in der arbeit vorgestellt eine untersuchung der flussdiagramme der zwei qubit systeme deutet auf einen grundzustand hin in dem die quantenstörstellen effektiv ferromagnetisch gekoppelt sind in diesem zustand zeigen sowohl die mittlere besetzung als auch die mittlere auslenkung der umgebungsorbitale eine deutliche erhöhung direkt an den störstellen die eindeutige zuordnung einer längenskala auf der die betrachteten signale abnehmen ist derzeit nicht möglich
